

Proposed Enhancements to Stock Audit Software

1. Group-wise / Subgroup-wise Stock Take Provision

Objective

To streamline the stock audit process by enabling department-wise inventory segmentation into Groups and Subgroups for better control, monitoring, and reporting.

Current Process

- Stock audits are conducted at the department level.
- Users can select one or more departments for stock audit.

Proposed Workflow

Step 1: Audit Initialization

User should be able to select:

- Store Name
- Audit Date
- Department
- Group
- Subgroup

Step 2: Data Pull

- System should pull only the selected Group/Subgroup inventory from ERP into the Audit System.

Step 3: Scanning Process

Users scan only the selected category items.

System should track:

- Zone-wise coverage
- User-wise scanning activity
- Real-time scanned quantity

Step 4: Reporting

System should generate:

- Group-wise discrepancy report
- Subgroup-wise discrepancy report
- Zero-scan report
- Final audit summary report

2. Decimal Quantity Input via Scanner

Objective

To eliminate manual entries for weighted items (UOM: KG) such as Fruits & Vegetables, Souk items, and similar categories.

Current Process

- Auditor weighs the item.
- Prepares a manual sheet containing Item Number, Item Description, and Quantity.
- Quantity is manually entered into the Audit System.

Proposed Workflow

Scanner should allow quantity entry with decimal values such as 1.25, 2.50, and 0.75.

System should:

- Accept decimal quantities based on Item UOM.
- Restrict invalid quantity formats.
- Auto-round quantities based on predefined business rules if required.

Expected Benefits:

- Reduction in manual data entry
- Reduced correction efforts
- Improved inventory accuracy
- Faster audit completion

3. Group-wise and Subgroup-wise Reporting Requirement

Current Process

- Download All Pending Items Report contains only zero-scan items.
- Download Consolidated Discrepancy Report excludes zero-count items.

Proposed Requirement

Reports should include complete discrepancies including zero-count items.

Required Report Fields:

- Sr. No
- Shop Code
- Item Code
- Item Description
- Department Name
- Group Name
- Subgroup Name
- System Quantity

- Physical Quantity
- Book Quantity
- Variance Quantity
- Variance Value

4. Excel Upload Tool for Recounted Items

Objective

To simplify the recount adjustment process and eliminate manual scanner entries for revised quantities.

Current Process

- Audit team updates recount quantities manually in Excel.
- Differential quantities are punched manually into scanners.
- TB upload is completed in ERP after recounting.
- Adjustment report is downloaded for sign-off.

Proposed Workflow

Step 1: Download Recount Sheet

System should generate an Excel template containing:

- Item Code
- Item Description
- Item Value
- System Quantity
- Physical Quantity
- Variance Quantity
- Variance Value

Step 2: Quantity Update

- Audit team updates only revised quantities in the Excel sheet.

Step 3: Excel Upload

- User uploads the updated Excel file into the Audit System.

Step 4: System Update

- Automatically update recounted quantities.
- Overwrite previous count quantities with the latest recount quantity.

Step 5: Audit Log

System should maintain:

- Upload date & time
- User details
- Before vs. after quantity history

Step 6: TB Upload into ERP

Expected Overall Benefits

- Simplified audit execution
- Reduced manual intervention
- Improved stock accuracy
- Faster reconciliation process
- Better audit traceability
- Enhanced reporting and analysis
- Reduced operational errors
- Improved accountability through audit logs
